For Immediate Release:

TAMP Systems Offers New Pandemic and Health Crisis Planning Services

Merrick, NY May 1, 2006: TAMP Systems (TAMP), the creator of the Disaster Recovery System (DRS™) planning software and consulting solutions for business continuity and disaster recovery announces its latest Pandemic and Health Crisis Planning services. This service helps companies become prepared to decrease the risk of infection, spreading the virus and managing through the potential business interruptions that would occur as a result of a pandemic-type event, such as the Bird Flu. “Recent disasters have proven time and time again that people are the most important company asset. Our livelihoods rely on how best prepared we are for the Avian Flu and other pandemic realizations. A scary fact is that more than 50% of the people infected with the H5N1 virus have already died. Being informed and prepared is essential to minimizing the health effects of a pandemic and its resulting consequences,” states Tom Abruzzo, President of TAMP Systems.

TAMP’s Pandemic and Health Crisis Planning Service is comprised of four planning phases and plans. Because of the uncertainty of such a devastating event and resulting business interruptions, steps need to be taken immediately in order to be prepared. The approach prepared by TAMP includes: (1) Preparation - the Pandemic Awareness and Prevention Plan, which reduces the spread of the flu; (2) Risk Mitigation - the Pandemic Readiness Plan, which identifies what should be done to prepare a business in the event of a pandemic (i.e., the employees who can and will work from external locations such as home) and how they will do so (i.e., telecommuting); (3) Response – the Continuity and Recovery Plan, which focuses on what to do during the health crisis; and (4) Post Event – the Post Event Plan, which addresses what to do after the flu has passed.

About TAMP Systems: TAMP provides a comprehensive resource and document management software system specifically designed for business continuity and disaster recovery planning. The Disaster Recovery System (DRS™) is a web-based software solution that is easy to learn and features automatic plan creation and updating of plan content. For over 20 years, TAMP has focused solely on developing solutions for contingency and recovery planning. Our DRS-certified consultants provide customized planning services to ensure that plans meet regulatory requirements.
